PROFESSIONAL SUMMARY

Clouds Devops Engineer with 3 years of experience designing and managing scalable cloud infrastructure for Global Payments Inc. and Gerdau North America. Expertise includes building infrastructure as code with Terraform to secure payment processing environments and automating CI/CD pipelines through GitHub Actions. Managed Kubernetes clusters on Amazon EKS and Azure to host microservices, utilizing Istio service mesh for traffic management and HashiCorp Vault for sensitive credential encryption. Developed AWS Lambda functions for real-time merchant analytics and created Python scripts to automate SAP HANA database maintenance. Implementation of Datadog monitoring and ELK stack logging reduced latency and simplified debugging across global payment gateways and industrial logistics systems. Optimized cloud spending via AWS Cost Explorer and automated resource scheduling, significantly lowering operational costs. Designed auto-scaling policies for EC2 instances to maintain system uptime during peak payroll processing periods while ensuring data integrity through automated backup strategies for Amazon Aurora. Integration of AI-driven operations tools predicted system failures, maintaining high availability for merchant-facing portals and internal steel production monitoring tools across North America.

TECHNICAL SKILLS

Others: Python, AWS Cost Explorer
Automation & CI/CD: Terraform, GitHub Actions
Cloud Infrastructure: AWS, Azure, EC2, AWS Lambda
Monitoring & Logging: Datadog, Prometheus, Grafana, ELK stack
Security & Networking: HashiCorp Vault, Azure Virtual Networks, VPN gateways
Databases & Enterprise Software: Amazon Aurora, SAP HANA, SAP
Containerization & Orchestration: Kubernetes, Amazon EKS, Istio

WORK EXPERIENCE

Global Payments Inc., Clouds Devops Engineer **Jan 2025 - Present**

- Developed infrastructure as code using Terraform to manage AWS resources for secure payment processing environments while ensuring high availability and compliance.
- Improved transaction processing speed by managing Kubernetes clusters on Amazon EKS to host microservices across multiple regions with optimal resource utilization.
- Built CI/CD pipelines using GitHub Actions to automate the testing and deployment of payment software updates, reducing manual errors and delivery cycles.
- Delivered a secure secret management system using HashiCorp Vault for managing API keys and encryption certificates across the global payment gateway infrastructure.
- Created monitoring dashboards in Datadog to track real-time transaction health and alert the team about latency issues in the payment processing flow.
- Developed AWS Lambda functions to process asynchronous data feeds for merchant analytics, improving the speed of reporting services for international partners.
- Coordinated the implementation of Istio service mesh to secure communication between internal microservices and improve traffic management across the cloud environment.
- Managed Amazon Aurora databases and implemented automated backup strategies to ensure data integrity and disaster recovery for critical financial transaction records.
- Analyzed cloud spending patterns using AWS Cost Explorer and implemented tagging policies to reduce monthly infrastructure expenses without impacting system performance.
- Utilized AI-driven operations tools to predict potential system failures and automated the remediation steps to maintain uptime for merchant-facing payment portals.

Gerdau North America, Cloud DevOps Engineer **Jan 2023 – May 2024**

- Built Terraform modules to deploy AWS infrastructure for SAP payroll applications, ensuring consistent environments across US and Canadian manufacturing sites.
- Developed GitHub Actions workflows that automated code testing and deployment for Gerdau’s internal steel production monitoring tools and logistics tracking software.
- Developed Prometheus and Grafana dashboards to monitor the health of cloud-native applications supporting payroll tax compliance and financial reporting tasks.
- Managed Kubernetes clusters on Azure to host microservices that integrated SAP data with local inventory management systems at various steel mills.
- Implemented HashiCorp Vault to manage secrets and sensitive credentials for automated payroll posting processes, improving overall security for sensitive employee data.
- Created Python scripts to automate routine database backups and maintenance tasks for the SAP HANA instances running on Gerdau’s cloud platform.
- Analyzed cloud spending patterns using AWS Cost Explorer and implemented automated resource scheduling to reduce monthly operational expenses for non-production environments.
- Built centralized logging systems using ELK stack to aggregate logs from distributed applications, simplifying the debugging process for payroll processing errors.
- Configured Azure Virtual Networks and VPN gateways to provide secure connectivity between the Tampa headquarters and remote steel manufacturing facilities across North America.
- Designed auto-scaling policies for EC2 instances to handle increased traffic during peak payroll processing periods at the end of fiscal quarters.

EDUCATION

University of North Texas, 0Denton, TX, Master of Science in Computer Science | GPA: 3.6/4. May 2026
